EDUCATION

B.S. Artificial Intelligence · University of Haripur, Pakistan

Oct 2024 – Expected 2028

Coursework: AI Algorithms, OOP, Database Systems, Programming Fundamentals

INTERNSHIP

AI Engineering Intern · Decode Labs (Remote)

Jun 2026 – Present

- Built a rule-based chatbot in plain Python — no ML libraries. Stored responses in a dictionary so adding new replies is straightforward and the logic stays easy to follow.
- Handled messy input (mixed case, extra spaces) so the bot responds correctly regardless of how the user types.
- Kept the conversation running in a loop until the user types "bye" or "exit", which made the bot feel more natural to use.
- The main thing I took away: how to structure a program around a loop, handle unexpected input gracefully, and keep the code easy to extend later.

PROJECTS

Hotel Management System

github.com/connect2waqas/Hotel-managment-system

- A command-line app covering registration, login, room booking, food ordering, and payments. The goal was to practice breaking a larger program into separate files, each with one job.
- Stored passwords using hashing rather than plain text — something I looked into while building the auth module because I wanted to do it the right way.
- Working across 9 Python files taught me how to manage imports cleanly and think about how different parts of a program talk to each other.

Object-Oriented Programming — Coursework Repository

github.com/connect2waqas/OOP

- Worked through all four OOP pillars — classes, inheritance, polymorphism, encapsulation — via practical exercises rather than just reading about them.
- Built an ATM simulation to practice private data, a Point/Line geometry calculator to practice operator overloading, and a student grade system to practice putting logic inside a class.
- Focused on understanding why each concept exists, not just making the code run — added comments throughout explaining the reasoning behind each design choice.

Python Data Analysis with Pandas

github.com/connect2waqas/Python-Pandas

- Practised loading CSV and JSON datasets, inspecting their structure, and filtering rows and columns based on conditions — using a real sales dataset throughout.
- Worked through multi-condition filtering, column selection, and basic statistics to get comfortable with the standard Pandas workflow before moving to more complex analysis.

REST API Integration — Python Requests

github.com/connect2waqas/API

- Built a weather app that calls the OpenWeatherMap API and shows live temperature, conditions, and humidity — my first time consuming a real external API.
- Learned to read JSON responses, pass query parameters, and handle errors properly (network failures, bad city names) rather than just assuming requests always succeed.
- Went through structured exercises on GET, POST, PUT, DELETE, authentication, and timeouts to understand what is happening at the HTTP level, not just how to copy-paste working code.

TECHNICAL SKILLS

Languages: Python

Data & Analysis: Pandas, NumPy, Matplotlib

APIs: REST API calls using Python requests, JSON parsing, error handling, API key authentication

Databases: SQL, relational database design

OOP: Classes, inheritance, polymorphism, encapsulation — applied across multiple projects

Tools: Git, GitHub, VS Code, Jupyter Notebooks
